Data from NASA GSFC and University of Wisconsin

The same plume in the vertical

This is why ground monitors in GA/FLA didn't ring bells

(more on this later.....)

NASA Three-Dimensional Air Quality System (3D-AQS) Project

- Integrate NASA satellite sensor and lidar data into EPA's operational air quality data systems: AQS/AirQuest, AirNow
- Provide greater accessibility and usability of satellite and lidar data to all users of these systems: IDEA, Smog Blog, REALM
- Develop visualization tools in horizontal and vertical dimensions for comparison with CMAQ forecasts and retrospective analysis

Why are we interested in measuring air quality data in 3D?

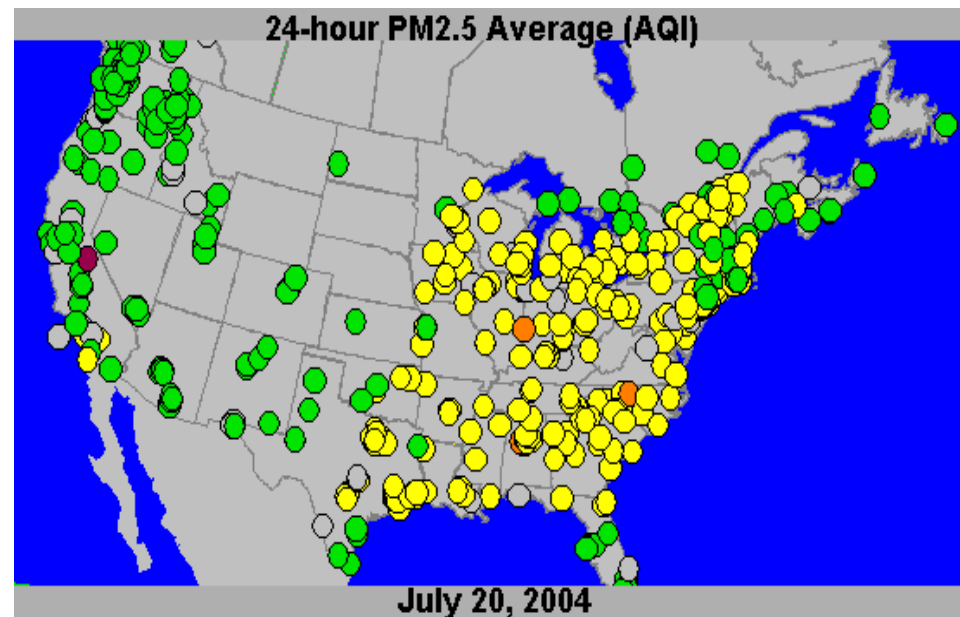

- Regional haze and regional scale events
- Long and medium range transport
- Clean Air Interstate Rule
- Improved modeling and validation of models
- Regulatory accountability
- Health endpoints?

Satellite sensors can provide horizontal data coverage, ground and space-based lidar can measure aerosols in the vertical dimension.

"At this point, we are ants on a two dimensional world...."

Current Datasets: Ambient Air Monitoring for Aerosols

- “True” measure of air quality
 - Varying temporal scales (hourly, daily, 1 in 3 days)
 - Sparse networks spatially
- Ground-based concentration in mass units ($\mu\text{g} / \text{m}^3$)
- Monitors usually sited in urban or rural areas only, e.g.,
 - Urban FRM network
 - IMPROVE in Class I areas
- Used for forecasting and historical analysis (including compliance)
- Decision support systems include:
 - AQS / AirQuest (<http://www.epa.gov/ttn/airs/airsaqs/>)
 - AIRNow (<http://www.airnow.gov>)

Partnership Area

Decision-Support Tools

AIRNow/AQS-EPA/NOAA

- Increase synoptic data for PM_{2.5} forecasters
- AQS/AIRQuest (EPA)
- Multi-dimensional aerosol related data and analyses:
- Assess general state of air quality and trends
- Assess progress of SIPs and compliance
- Waivers to air standards
- Air quality rule development
- NEPHTN-PHASE (CDC)
- Produce better AQ maps through statistical models

Value & Benefits to Citizens & Society

Increase accuracy in AQ forecast: reduce poor air quality health impacts.

Increase knowledge in causes or poor air quality – leading to improvements in AQ and confidence in government.

Improved prevention initiative targeting.

 **UMBC Atmospheric Lidar Group** 

Atmospheric Lidar Group Description:

We are interested in remote sensing of the atmosphere with a focus on aerosols and aerosol properties. We have two Light Detection And Ranging (LIDAR) Facilities that allow us to make active measurements of the aerosols in the atmosphere. We also have a nephelometer to make ground measurements of aerosols. We also utilize passive instruments such as satellites to look at the regional variability and development of aerosols.

[Current UMBC-ALG Webcam Image](#)

Projects:

-  **US Air Quality**
 - The USAQ smog blog is a daily diary of the U.S air quality. We use information from NASA satellites, ground-based lidar, EPA monitoring networks, and other monitors to reinforce our posts.
-  **REALM**
 - Regional East Atmospheric Lidar Mesonet (REALM) is designed to monitor air quality in the vertical from multiple locations on the east coast.
-  **ELF**
 - Elastic Lidar Facility (ELF) that operates at 532nm. It measures aerosol profiles of the atmosphere.
-  **UMBC Nephelometer**
 - The UMBC Nephelometer makes a ground measurement of the backscatter coefficient.
-  **ALEX**
 - Atmospheric Lidar Experiment (ALEX) is a Raman lidar that operates at

CLEAR, LIGHT HAZE, AND CLOUDS

Daily posts

Beautiful clear skies in much of the eastern with a few exceptions in the midwest.

and cloudy in the west. PM2.5 concentrations were similar, mostly good

About U.S. Air Quality

USAQ is a daily diary of air quality in the U.S. using information from NASA satellites, ground-based lidar, EPA monitoring networks, and other monitors. Interpretation and analysis is provided by the staff of the University of Maryland, Baltimore County Atmospheric Lidar Group.

SOUTHCENTRAL HAZE

The remnants of hurricane Ivan continued up the eastern U.S. producing very heavy rain and strong storms. The midwest and west were clear, but some smoky haze has built up in the southcentral region (Texas, Oklahoma, Arkansas, Louisiana).

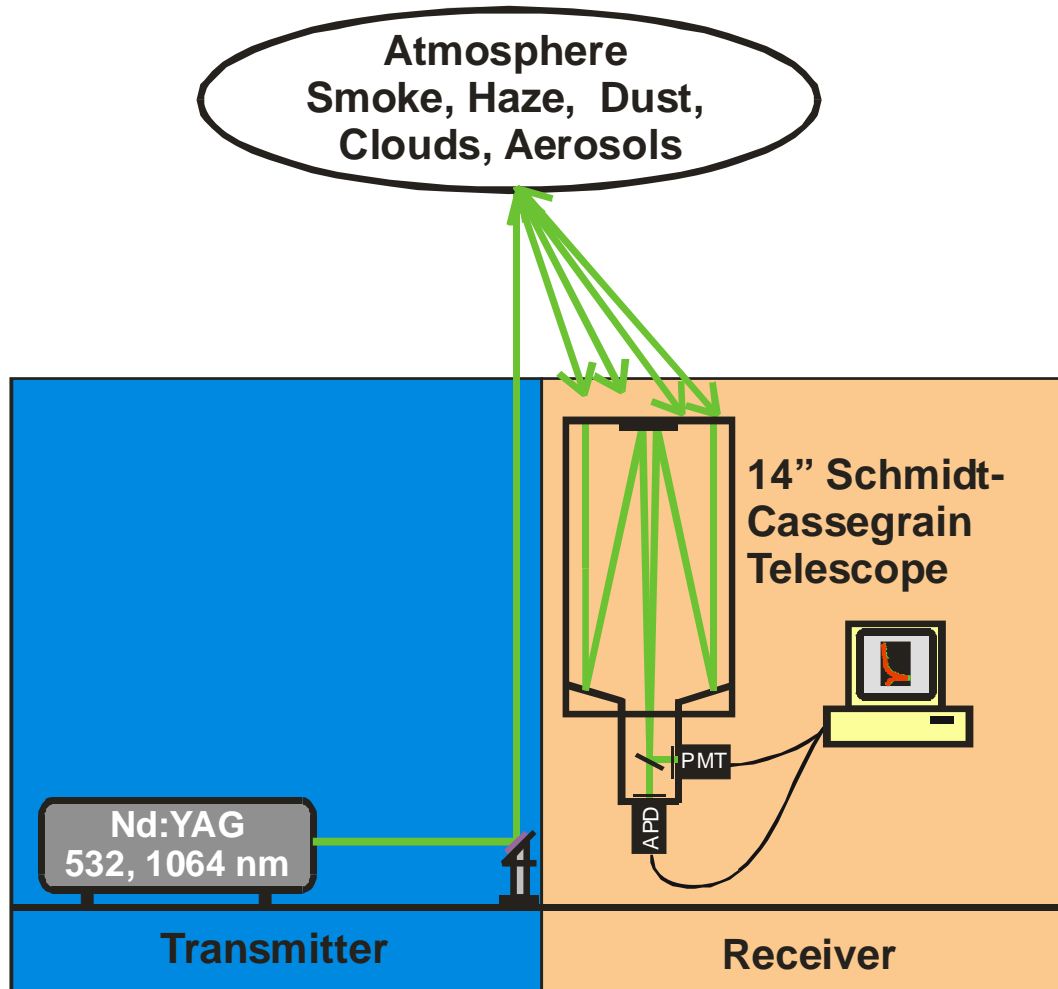

Daily posts from 3.5 years ~ 35,000 visitors per month, including universities, EPA, NASA, NOAA, & States, and general public

Progress of 3D-AQS Project (6/07)

Progress

- Determined priority datasets:
 - MODIS AOD and PM_{2.5} monitor matched data
 - GASP AOD, AERONET AOD, LIDAR profiles and AOD
- Ported 2004-2006 MODIS AOD-PM_{2.5} matched station data to AirQuest
- Started development of finer resolution AOD data (5x5km and 2x2 km)
- Started development of 3D visualization methods
- Transferring IDEA to operational NOAA environment - Add GASP
- Formation and interaction with end user committee

Timeline

- 2007-08: Evaluation of other sensors (OMI, AIRS) for integration into AirQuest. Implementation of 3D visualization and data output.
- 2008-09: Complete data integration and transition to operations

3D-AQS Needs Input

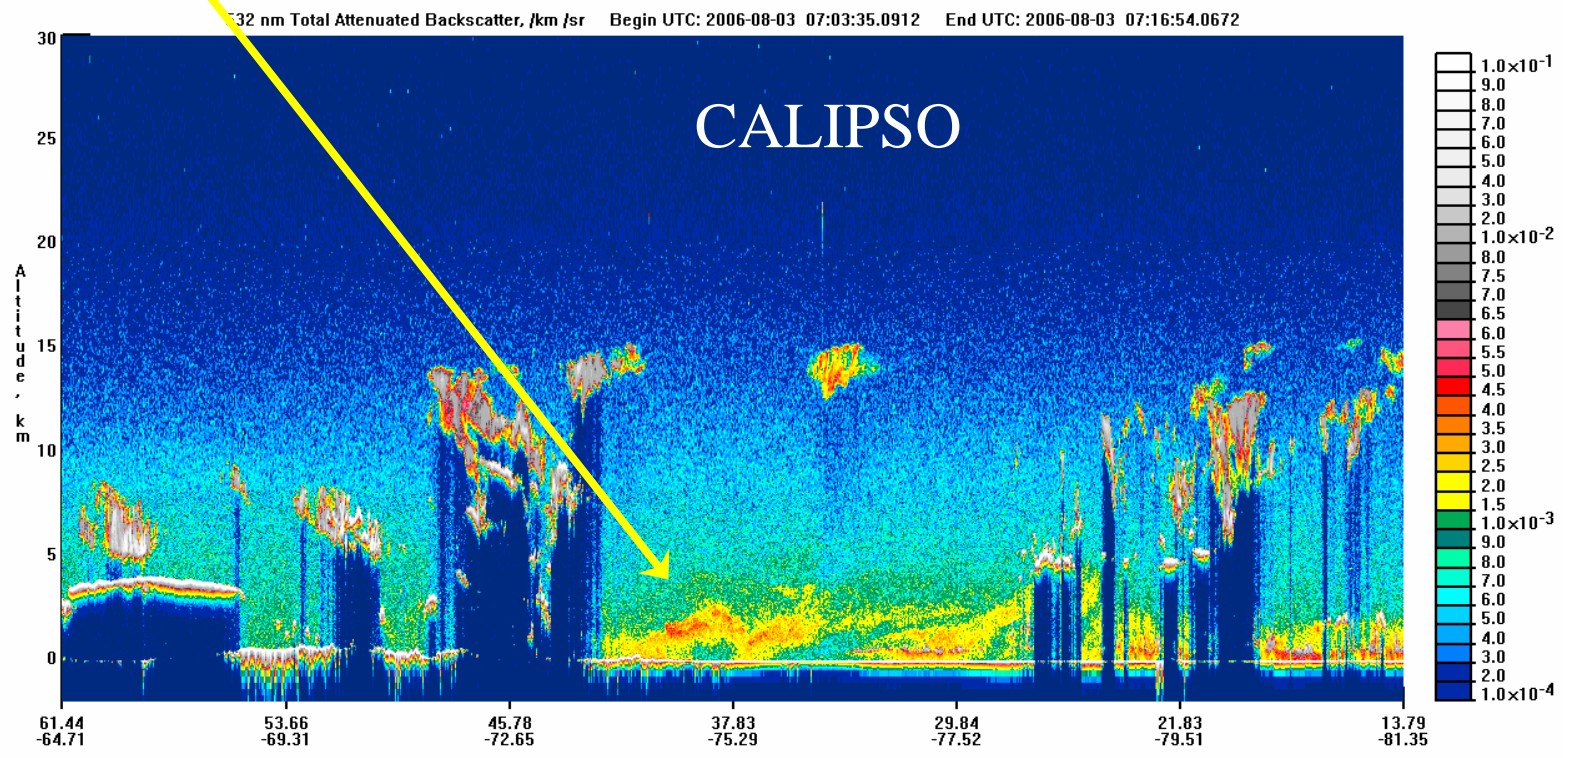

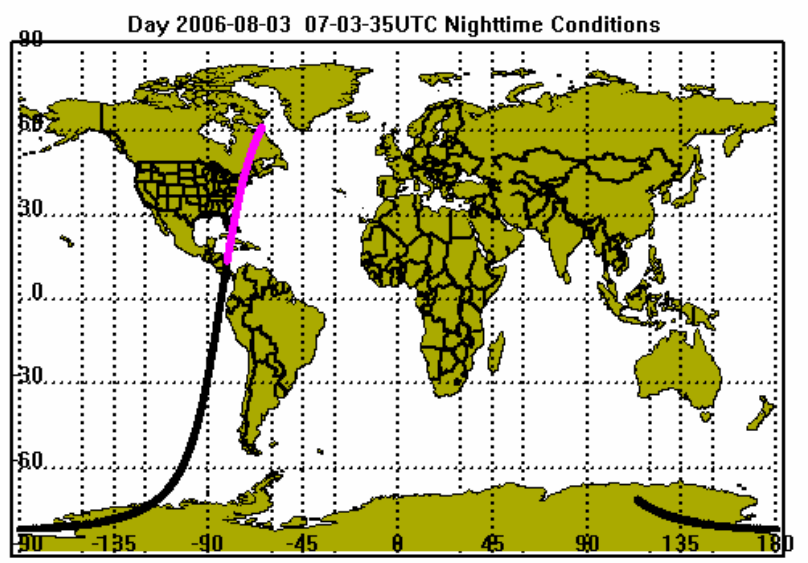

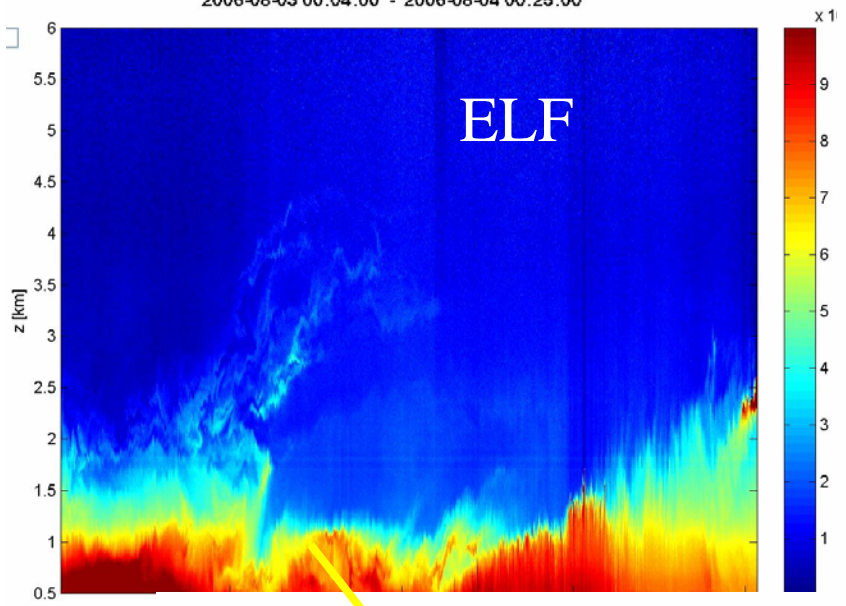

- End user input needed
 - Input sought through end user committee
 - Email always welcome: engelcoxj@battelle.org
- Type of input needed
 - Data types of interest
 - Level of processing and format required
 - Type and style of visualization
 - Temporal and spatial needs
- Better data accessibility = more use and demand for environmental information = greater understanding of our atmosphere
